REASONS FOR ALLOWANCE

1. The following is an examiner's statement of reasons for allowance: The prior art taken either singularly or in combination fails to anticipate or fairly suggest the limitations of the independent claim(s), in such a manner that a rejection under 35 U.S.C. 102 or 103 would be proper. The prior art fails to teach a combination of all the claimed features as presented in claim(s) 1-10, wherein a zoom lens barrel comprises a cam ring driven to rotate; a first lens frame positioned around said cam ring to be guided linearly; a light-shield exterior ring position around the first lens frame; a first outer cam groove and a second outer cam groove formed on the outer surface of the cam ring; a first cam follower; a second cam follower formed on said light-shield exterior ring, said second cam follower being engaged in said second outer cam groove through a linear guide slot; and wherein said first outer cam groove and said second outer cam groove are shaped so as to move said first lens frame and said light-shield exterior ring in the same moving path in zooming ranges, as claimed.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Conclusion

2. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

The following references are cited for disclosing a zoom lens barrel having a shield member, a cam ring, cam frames and cam followers, but the references either do not qualify as prior art or do not disclose a zoom lens barrel comprises a cam ring driven to rotate; a first lens frame positioned around said cam ring to be guided linearly; a light-shield exterior ring position around the first lens frame; a first outer cam groove and a second outer cam groove formed on the outer surface of the cam ring; a first cam follower; a second cam follower formed on said light-shield exterior ring, said second cam follower being engaged in said second outer cam groove through a linear guide slot; and wherein said first outer cam groove and said second outer cam groove are shaped so as to move said first lens frame and said light-shield exterior ring in the same moving path in zooming ranges, as claimed: Nomura et al.
